

# Boston II Study | miLung Test Information for Participants

You recently received a low-dose CT scan as part of your lung cancer screening and we would like to invite you to take part in a research study to improve lung cancer screening.

Your Hospital and Hummingbird Diagnostics are partnering in a large study with 2,000 participants for early detection of lung cancer based on Hummingbird's miLung blood test.

© Hummingbird Diagnostics GmbH | Jan. 2024

Your participation in this study would include:

Just one visit!

Single blood draw

Review of your records

No presence required!

By participating in our study, you are making an important contribution to significantly improving the early detection of lung cancer in the future.

Your participation is highly appreciated!

**Hummingbird**  
**Diagnostics**

Hummingbird Diagnostics develops blood-based diagnostic tests for early disease detection, personalized medicine and disease monitoring.

Our tests merge tumor-derived biomarkers and immune response diagnostics using small RNAs, tiny disease-specific molecules.
